

Remaining Manual Tasks

Everything from the 35-issue audit that code alone could not finish — each needs a real account, a live domain, or a business decision only you can make. Print this and check items off as you go.

Generated August 29, 2026 • Companion to PR: Keepsake Almanac fixes • Oak and Main Developers LLC

What Got Finished Automatically

Of the 35 numbered issues in the audit, **30 were fully implemented in code** and are sitting in the pull request, already built and verified (production build succeeds, linter is clean, and the accessibility/behavior fixes were re-tested with the same automated tooling — axe-core and scripted browser tests — used in the original audit). The remaining **5 need a real Cloudflare/Google/affiliate-network account, a live domain, or a content decision** that only you can make. Those are detailed below.

#	ISSUE	STATUS
1–3, 5–6	Date-driven almanac, real calendar "today", persistence, data export	✓ Done
4	Memory API wired to Cloudflare KV	⚠ Code done — namespace creation is manual (Task 1 below)
7–13	Security headers, robots.txt, sitemap, canonical, OG/Twitter/JSON-LD	✓ Done
14	Real routing (react-router) for all 6 sections + legal pages	✓ Done
15–21	Accessibility: labels, contrast, focus trap, skip link, heading order	✓ Done
22–23	Web app manifest, brand-matched icons, theme-color	✓ Done
24	Service worker (installable PWA)	✓ Done — live install/Lighthouse check is manual (Task 5)
25–26	Mobile nav scroll affordance, above-the-fold rebalance	✓ Done
27	Privacy Policy & Terms of Service	⚠ Drafted with your business info — legal review recommended (Task 4)
28	Third-party image dependency removed	✓ Done — replaced with locally-hosted branded illustrations
29–30, 32–33	Fabricated dates, sample-data disclosure, confetti wired up, image hygiene	✓ Done
31	Favicon/icons redesigned in the real brand palette	✓ Done

34	Affiliate disclosure component + placement scaffolding	⚠ Structure done — real affiliate links are manual (Task 3)
35	CI (lint + build on every push)	✅ Done

Also fixed along the way, beyond the original 35: a real "SPA fallback" redirect rule (without it, refreshing on `/vault` etc. would have 404'd on Cloudflare Pages), a proper 404 page, and two small pieces of genuinely dead code the linter caught once it was actually run for the first time.

Task 1 — Create the Cloudflare KV Namespace

Provision real server-side storage for submitted memories

~10 MIN

The `/api/submit-memory` Cloudflare Pages Function now writes to KV storage *if a binding named `MEMORIES` exists* — otherwise it quietly no-ops and your data still saves locally, so nothing breaks either way. To make the server-side backup real:

Option A — via the Cloudflare dashboard (if this project deploys through Git integration)

1. Cloudflare dashboard → Workers & Pages → your Keepsake Almanac project → Settings → Functions.
2. Under "KV namespace bindings," add a binding: variable name `MEMORIES`, and either select an existing KV namespace or create a new one from that screen.
3. Redeploy (or the next push will pick it up).

Option B — via Wrangler CLI (if you deploy with `wrangler pages deploy`)

```
wrangler login
wrangler kv namespace create MEMORIES
```

Copy the returned namespace `id`, then uncomment and fill in the block already sitting in `wrangler.toml` at the repo root:

```
[[kv_namespaces]]
binding = "MEMORIES"
id = "PASTE_THE_REAL_ID_HERE"
```

Verify it worked: add a memory on the live site, then check the namespace's contents in the Cloudflare dashboard's KV viewer for a new entry.

Task 2 — Search Engine Indexing

Submit the sitemap and verify domain ownership

~20 MIN

The audit found zero indexed pages for keepsakealmanac.com. The sitemap, robots.txt, canonical tags, and Open Graph/JSON-LD are all in place now — but a search engine still needs to be told the site exists and prove you own it, which requires live access to the domain.

1. **Google Search Console** (search.google.com/search-console): add the property for `keepsakealmanac.com`, verify ownership (DNS TXT record is usually simplest, since Cloudflare manages the domain), then submit `https://keepsakealmanac.com/sitemap.xml` under Sitemaps.
2. **Bing Webmaster Tools** (bing.com/webmasters): same idea — you can also import directly from a verified Google Search Console property, which is faster than re-verifying from scratch.
3. Once indexed, spot-check with `site:keepsakealmanac.com` on Google after a few days — that query returned zero results in the original audit.

Task 3 — Real Affiliate Links

 Sign up for affiliate programs and drop in real links

ONGOING

Three "Recommended Resources" placements now exist in the app — Print & Export (book binding), Family Heritage (DNA testing/genealogy), and Time Capsules (memorial keepsakes) — each with the required disclosure line already in place. Every link is currently a placeholder (`href="#"` , tagged `data-affiliate-placeholder="true"` in the source for easy find-and-replace).

PLACEMENT	PROGRAM SUGGESTIONS	FILE
Print & Export	A photo-book/binding service's affiliate or referral program (e.g. a print-on-demand book publisher)	<code>src/components/PrintExporter.tsx</code>
Family Heritage	AncestryDNA, MyHeritage, or 23andMe affiliate program	<code>src/components/FamilyHeritage.tsx</code>
Time Capsules	Archival/memorial keepsake or recordable-audio product affiliate program	<code>src/components/TimeCapsules.tsx</code>

These require applying to each program directly (typically a short application, sometimes with approval delay) — not something that can be done without your business/tax details on file with each network.

Task 4 — Legal Review

☐ Have an attorney review the Privacy Policy and Terms

RECOMMENDED

The new `/privacy` and `/terms` pages are real, substantive documents — not filler — written to accurately describe the app's actual data handling (local-first storage, optional KV backup, no trackers) and include California-specific disclosures (CCPA/CPRA rights, Shine the Light) since Oak and Main Developers LLC operates in California. That said, this was drafted by an AI, not counsel. Standard practice — especially once real user data or affiliate revenue is involved — is a licensed-attorney pass before treating it as final compliance documentation.

Task 5 — Live Verification After Deploy

☐ Confirm everything works on the real, live domain

~15 MIN

This work was built and tested against a local production build inside a sandboxed environment with no general internet access — every fix was verified there, but nothing could be checked against the actual keepsakealmanac.com domain. After this PR merges and deploys, a quick pass is worth doing:

- Run securityheaders.com against the live domain to confirm the `_headers` file is being honored by Cloudflare Pages as expected.
- Paste the homepage URL into Facebook's Sharing Debugger, Twitter's Card Validator, and/or LinkedIn's Post Inspector to confirm the new OG image and tags render correctly when shared.
- Run a Lighthouse audit (Chrome DevTools → Lighthouse) against the live site — PWA installability, accessibility, and performance scores can now be measured for real, which wasn't possible from this sandbox.
- Refresh the browser while sitting on `/vault` or another non-root URL to confirm the `_redirects` SPA fallback rule is working (should load normally, not 404).

One Content Decision Worth Making

The "Daily Almanac" now genuinely changes with the real date — the season, moon phase, and sunrise/sunset are computed live. But the "On This Day in Family History" feed only has sample entries for August 9 (the fictional Harrison family's original demo date); every other day now honestly shows an empty state instead of fabricated history, which was the deliberate fix. Worth deciding, whenever you're ready: keep it as a blank canvas for your own family's real entries, or ask for a batch of genuine general-almanac "on this day" content (real historical/seasonal facts, not a fictional family) to give the feature more day-to-day substance out of the box.
